

Jake Mosby pages 143-162

During the year a mill would send recruits to come down to the mine. They would work in the mine to see if it was the life for them. One person who came down was Jake. He was a veteran and was moot with the ladies. He was interested in the rockets along with Mr.Dubonnet, so they said they would come to the next launching.

But before they could do another launching they needed to get cement for their launch pad. So Homer decided he was going to ask his dad again. His dad told them that they might find some ruined cement by a fan. When they went there though, they found four pristine bags of cement that they could use. So they finished making their launch pad. They were ready for another launch. Mr. Dubonnet and Jake came like they said they would. They launched a few rockets and found they needed to let the powder cure more. When they tested their next rocket it went a lot higher. They learned they need to learn trigonometry to find how it flew. That weekend they went with Jake and watched a meteor, their love with space grew even more.
